

A 卷答案:

一、T F T D C B B D

二、

1. 解:

$$\begin{aligned} \text{原式} &= \begin{vmatrix} 1 & 1 & -1 & 2 \\ -1 & -1 & -4 & 1 \\ 2 & 4 & -6 & 1 \\ 1 & 2 & 4 & 2 \end{vmatrix} \begin{matrix} r_2 + r_1 \\ r_3 - 2r_1 \\ = \\ r_4 - r_1 \end{matrix} \begin{vmatrix} 1 & 1 & -1 & 2 \\ 0 & 0 & -5 & 3 \\ 0 & 2 & -4 & -3 \\ 0 & 1 & 5 & 0 \end{vmatrix} \begin{matrix} r_2 \leftrightarrow r_4 \\ = \end{matrix} \begin{vmatrix} 1 & 1 & -1 & 2 \\ 0 & 1 & 5 & 0 \\ 0 & 2 & -4 & -3 \\ 0 & 0 & -5 & 3 \end{vmatrix} \begin{matrix} r_3 - 2r_2 \\ = \end{matrix} \\ &= \begin{vmatrix} 1 & 1 & -1 & 2 \\ 0 & 1 & 5 & 0 \\ 0 & 0 & -14 & -3 \\ 0 & 0 & -5 & 3 \end{vmatrix} = - \begin{vmatrix} 1 & 1 \\ 0 & 1 \end{vmatrix} \begin{vmatrix} -14 & -3 \\ -5 & 3 \end{vmatrix} = -1 \times (-42 - 15) = 57 \\ &() \end{aligned}$$

2. 解:

原式

$$\begin{aligned} &= \begin{vmatrix} a & a & \cdots & a & x \\ a & a & \cdots & x & a \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a & x & \cdots & a & a \\ x & a & \cdots & a & a \end{vmatrix} \begin{matrix} r_1 + r_2 + \cdots + r_n \\ = \\ (n-1)a + x \end{matrix} \begin{vmatrix} 1 & 1 & \cdots & 1 & 1 \\ a & a & \cdots & x & a \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a & x & \cdots & a & a \\ x & a & \cdots & a & a \end{vmatrix} \\ &= \begin{vmatrix} r_2 - ar_1 \\ r_3 - ar_1 \\ \cdots \\ r_n - ar_1 \end{vmatrix} \begin{vmatrix} 1 & 1 & \cdots & 1 & 1 \\ 0 & 0 & \cdots & x - a & 0 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ 0 & x - a & \cdots & 0 & 0 \\ x - a & 0 & \cdots & 0 & 0 \end{vmatrix} \\ &= (-1)^{\frac{n(n-1)}{2}} [(n-1)a + x] (x - a)^{n-1} \quad) \end{aligned}$$

三、解:

$$\begin{aligned} X &= \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}^{-1} \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix} \begin{pmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}^{-1} \\ &= \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix} \begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad () \\ &= \begin{pmatrix} 4 & 5 & 6 \\ 1 & 2 & 3 \\ 7 & 8 & 9 \end{pmatrix} \begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad () \\ &= \begin{pmatrix} 4 & 5 & 2 \\ 1 & 2 & 2 \\ 7 & 8 & 2 \end{pmatrix} \end{aligned}$$

四、解: 增广矩阵为:

$$B = \begin{pmatrix} 1 & 1 & 0 & : & 1 \\ 1 & 0 & -1 & : & 1 \\ 1 & a & 1 & : & b \end{pmatrix}$$

$$\xrightarrow[r_3 - r_1]{r_2 - r_1} \begin{pmatrix} 1 & 1 & 0 & : & 1 \\ 0 & -1 & -1 & : & 0 \\ 0 & a-1 & 1 & : & b-1 \end{pmatrix} \xrightarrow{r_3 + (a-1)r_2} \begin{pmatrix} 1 & 1 & 0 & : & 1 \\ 0 & -1 & -1 & : & 0 \\ 0 & 0 & 2-a & : & b-1 \end{pmatrix}$$

当 $a = 2, b \neq 1$ 时, 方程组无解,

当 $a \neq 2, b \neq 1$ 时, 方程组有唯一解,

当 $a = 2, b = 1$ 时, 方程组有无穷多解

当方程组有无穷多解时,

$$B \rightarrow \begin{pmatrix} 1 & 1 & 0 & \vdots & 1 \\ 0 & -1 & -1 & \vdots & 0 \\ 0 & 0 & 0 & \vdots & 0 \end{pmatrix} \xrightarrow[r_2 \times (-1)]{r_1 + r_2} \begin{pmatrix} 1 & 0 & -1 & \vdots & 1 \\ 0 & 1 & 1 & \vdots & 0 \\ 0 & 0 & 0 & \vdots & 0 \end{pmatrix}$$

方程组等价于 $\begin{cases} x_1 - x_3 = 1 \\ x_2 + x_3 = 0 \end{cases}$

令 $x_3 = 0$, 求得一个特解 $\eta^* = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$

导出组为 $\begin{cases} x_1 - x_3 = 0 \\ x_2 + x_3 = 0 \end{cases}$

令 $x_3 = 1$, 求得导出组基础解系: $\xi = \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix}$

因此通解为: $X = k\xi + \eta^* = k \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} + \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$, k 为任意常数

$$\text{五、} (\alpha_1, \alpha_2, \alpha_3, \alpha_4) = (e_1, e_2, e_3, e_4) \begin{pmatrix} 2 & 0 & 0 & 0 \\ 1 & 3 & 0 & 0 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 1 & 3 \end{pmatrix}$$

$$\text{因此由 } e_1, e_2, e_3, e_4 \text{ 到 } \alpha_1, \alpha_2, \alpha_3, \alpha_4 \text{ 的过渡矩阵 } P = \begin{pmatrix} 2 & 0 & 0 & 0 \\ 1 & 3 & 0 & 0 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 1 & 3 \end{pmatrix} \quad)$$

向量 $(x_1, x_2, x_3, x_4)^T$ 在 e_1, e_2, e_3, e_4 下的坐标即 $X = (x_1, x_2, x_3, x_4)^T$, 那么在 $\alpha_1, \alpha_2, \alpha_3, \alpha_4$ 下的坐标 $Y = P^{-1}X$ (1分)

$$\begin{pmatrix} 2 & 0 & 0 & 0 & : & x_1 \\ 1 & 3 & 0 & 0 & : & x_2 \\ 0 & 1 & 2 & 1 & : & x_3 \\ 0 & 0 & 1 & 3 & : & x_4 \end{pmatrix} \xrightarrow[r_2 - r_1]{r_1 \times \frac{1}{2}} \begin{pmatrix} 1 & 0 & 0 & 0 & : & \frac{1}{2}x_1 \\ 0 & 3 & 0 & 0 & : & -\frac{1}{2}x_1 + x_2 \\ 0 & 1 & 2 & 1 & : & x_3 \\ 0 & 0 & 1 & 3 & : & x_4 \end{pmatrix}$$

$$\xrightarrow[r_3 - r_2]{r_2 \times \frac{1}{3}} \begin{pmatrix} 1 & 0 & 0 & 0 & : & \frac{1}{2}x_1 \\ 0 & 1 & 0 & 0 & : & -\frac{1}{6}x_1 + \frac{1}{3}x_2 \\ 0 & 0 & 2 & 1 & : & \frac{1}{6}x_1 - \frac{1}{3}x_2 + x_3 \\ 0 & 0 & 1 & 3 & : & x_4 \end{pmatrix} \quad)$$

$$\xrightarrow[r_4 - r_3]{r_3 \times \frac{1}{2}} \begin{pmatrix} 1 & 0 & 0 & 0 & : & \frac{1}{2}x_1 \\ 0 & 1 & 0 & 0 & : & -\frac{1}{6}x_1 + \frac{1}{3}x_2 \\ 0 & 0 & 1 & \frac{1}{2} & : & \frac{1}{12}x_1 - \frac{1}{6}x_2 + \frac{1}{2}x_3 \\ 0 & 0 & 0 & \frac{5}{2} & : & -\frac{1}{12}x_1 + \frac{1}{6}x_2 - \frac{1}{2}x_3 + x_4 \end{pmatrix} \quad)$$

$$\xrightarrow[r_3 - \frac{1}{2}r_4]{r_4 \times \frac{2}{5}} \begin{pmatrix} 1 & 0 & 0 & 0 & : & \frac{1}{2}x_1 \\ 0 & 1 & 0 & 0 & : & -\frac{1}{6}x_1 + \frac{1}{3}x_2 \\ 0 & 0 & 1 & 0 & : & \frac{1}{10}x_1 - \frac{1}{5}x_2 + \frac{3}{5}x_3 - \frac{1}{5}x_4 \\ 0 & 0 & 0 & 1 & : & -\frac{1}{30}x_1 + \frac{1}{15}x_2 - \frac{1}{5}x_3 + \frac{2}{5}x_4 \end{pmatrix} \quad)$$

$$\text{因此在 } \alpha_1, \alpha_2, \alpha_3, \alpha_4 \text{ 下的坐标为 } \begin{pmatrix} \frac{1}{2}x_1 \\ -\frac{1}{6}x_1 + \frac{1}{3}x_2 \\ \frac{1}{10}x_1 - \frac{1}{5}x_2 + \frac{3}{5}x_3 - \frac{1}{5}x_4 \\ -\frac{1}{30}x_1 + \frac{1}{15}x_2 - \frac{1}{5}x_3 + \frac{2}{5}x_4 \end{pmatrix}$$

六、解：二次型的矩阵为：

$$A = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 2 & 3 \end{pmatrix}$$

$$\begin{aligned} |A - \lambda E| &= \begin{vmatrix} 2-\lambda & 0 & 0 \\ 0 & 3-\lambda & 2 \\ 0 & 2 & 3-\lambda \end{vmatrix} \\ &= (2-\lambda) \begin{vmatrix} 3-\lambda & 2 \\ 2 & 3-\lambda \end{vmatrix} = (2-\lambda) \begin{vmatrix} 5-\lambda & 2 \\ 5-\lambda & 3-\lambda \end{vmatrix} = (2-\lambda) \begin{vmatrix} 5-\lambda & 2 \\ 0 & 1-\lambda \end{vmatrix} \\ &= (2-\lambda)(5-\lambda)(1-\lambda) \end{aligned}$$

特征值为 $\lambda_1 = 2, \lambda_2 = 5, \lambda_3 = 1$

当 $\lambda_1 = 2$ 时, $(A - 2E)X = O$

$$\text{稀疏矩阵为: } \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 2 \\ 0 & 2 & 1 \end{pmatrix} \xrightarrow{\substack{r_1 \leftrightarrow r_2 \\ r_2 \leftrightarrow r_3 \\ r_2 - 2r_1}} \begin{pmatrix} 0 & 1 & 2 \\ 0 & 0 & -3 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\text{令 } x_1 = 1, \text{ 得 } \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$$

当 $\lambda_2 = 5$ 时, $(A - 5E)X = O$

$$\text{稀疏矩阵为: } \begin{pmatrix} -3 & 0 & 0 \\ 0 & -2 & 2 \\ 0 & 2 & -2 \end{pmatrix} \xrightarrow{\substack{r_1 \times (-\frac{1}{3}) \\ r_3 + r_2 \\ r_2 \times (-\frac{1}{2})}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\text{令 } x_3 = 1, \text{ 得 } \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix}$$

当 $\lambda_3 = 1$ 时, $(A - E)X = O$

$$\text{稀疏矩阵为: } \begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 2 \\ 0 & 2 & 2 \end{pmatrix} \xrightarrow{\substack{r_2 - r_3 \\ r_2 \times \frac{1}{2}}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\text{令 } x_3 = 1, \text{ 得 } \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix}$$

可见 $\begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix}$ 显然相互正交, 将他们单位化, 可得:

$$\xi_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad \xi_2 = \begin{pmatrix} 0 \\ \frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{pmatrix}, \quad \xi_3 = \begin{pmatrix} 0 \\ -\frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} \end{pmatrix}$$

$$\text{因此正交变换 } X = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} \\ 0 & \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} \end{pmatrix} Y$$

标准型为 $f(y_1, y_2, y_3) = 2y_1^2 + 5y_2^2 + y_3^2$

二次型的秩为 3,

为正定二次型

七、解:

$$\begin{aligned} A^4 &= \alpha^T \beta \alpha^T \beta \alpha^T \beta \alpha^T \beta \\ &= \alpha^T (\beta \alpha^T)^3 \beta \\ &= (\beta \alpha^T)^3 \alpha^T \beta \\ &= 3^3 \begin{pmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ 2 & 1 & \frac{2}{3} \\ 3 & \frac{3}{2} & 1 \end{pmatrix} \\ &= \begin{pmatrix} 27 & \frac{27}{2} & 9 \\ 54 & 27 & 18 \\ 81 & \frac{81}{2} & 27 \end{pmatrix} \end{aligned}$$

八、证明:

令 $k_0 X^* + k_1 X_1 + k_2 X_2 + \cdots + k_{n-r} X_{n-r} = O$

则 $A(k_0 X^* + k_1 X_1 + k_2 X_2 + \cdots + k_{n-r} X_{n-r}) = O$

即 $k_0 AX^* + k_1 AX_1 + k_2 AX_2 + \cdots + k_{n-r} AX_{n-r} = O$

因为 $X_1, X_2, \dots, X_{n-r}$ 是导出组的基础解系, 所以 $k_1 AX_1 + k_2 AX_2 + \cdots + k_{n-r} AX_{n-r} = O$

因此 $k_0 AX^* = k_0 b = O$

因为 $b \neq O$, 所以 $k_0 = 0$

那么 $k_1 X_1 + k_2 X_2 + \cdots + k_{n-r} X_{n-r} = O$

由于 $X_1, X_2, \dots, X_{n-r}$ 是导出组的基础解系, 它们之间互不相关, 因此 $k_1 = k_2 = \cdots = k_{n-r} = 0$

因此有 $k_0 = k_1 = k_2 = \cdots = k_{n-r} = 0$, 所以 $X^*, X_1, X_2, \dots, X_{n-r}$ 线性无关

九、证明:

如果 λ 是 n 阶幂零矩阵 A 的特征值, 其对应的一个特征向量记为 $X \neq O$, 则有

$$AX = \lambda X$$

$$\text{那么 } A^k X = \lambda^k X = O$$

$$\text{因此 } \lambda^k = 0,$$

$$\text{即 } \lambda = 0, \text{ 因此矩阵的特征值均为 } 0$$

$\lambda = 0$ 是幂零矩阵的所有特征值, 因此为 n 重特征值。

假设幂零矩阵 $A \neq O$ 能够对角化, 那么特征值 $\lambda = 0$ 所对应的特征子空间的维数应为 n , 即方程组 $(A - \lambda E)X = AX = O$ 的基础解系中解向量的个数为 n

$$\text{那么系数矩阵 } A \text{ 的秩 } R(A) = n - n = 0$$

$$\text{但是 } A \neq O, \text{ 因此根据一致条件必有 } R(A) \neq 0$$

即假设与已知条件矛盾

因此矩阵 A 不与对角矩阵相似
